Justin Vovk's *In Destiny's Hands* is the heartbreaking story of five children of

Austria's iconic empress, Maria Theresa, who watched as their royal worlds were ripped apart by tragedy and epic misfortunes. These are the stories of Joseph, whose disastrous reign forced Austria to the brink of civil war; Amalia, the brazen and scandalous duchess who married a boy-prince and died exiled and forgotten; Leopold, Maria Theresa's unassuming second son, who was the envy of Europe until his tumultuous reign was cut tragically short; Maria Carolina, the very Austrian queen of Naples, who ended her days fighting Napoleon with her dying breath; and Marie Antoinette, the legendary teenage bride, who was hated and reviled as Queen of France and met her ultimate fate on the guillotine, a

testimony to her mother's vain ambition. Painstakingly researched and masterfully crafted, *In Destiny's Hands* brings to vivid life the world of eighteenth century like never before. "Readers will find many fascinating details in Vovk's *In Destiny's Hands*. Vovk has shed... light on these individuals and provided a much needed new work on Maria Theresa's progeny." - Julia P. Gelardi, author of the critically acclaimed *Born to Rule: Five Reigning Consorts, Granddaughters of Queen Victoria and In Triumph's Wake: Royal Mothers, Tragic Daughters, and the Price They Paid For Glory* "Be prepared for heart break, smiles, and most of all, a roller coaster of enlightenment... you will not be able to it down." -David Antunes, M.A.,

Structural Health Monitoring and Integrity Management is a collection of the papers presented at the 2nd International Conference of Structural Health Monitoring and Integrity Management (ICSHMIM2014, Nanjing, China, 24-26 September 2014), and addresses the most recent developments in the field of Structural Health Monitoring (SHM) and integrity ma

This thesis provides the first atomic length-scale observation of the structural transformation (referred to as lattice reconstruction) that occurs in moiré superlattices of twisted bilayer transition metal dichalcogenides (TMDs) at low ( $\theta < 2^\circ$ ) twist angles. Such information is essential for the fundamental understanding of how manipulating the rotational twist-angle between two adjacent 2-dimensional crystals subsequently affects their optical and electrical properties. Studies using Scanning transmission electron microscopy (STEM), a powerful tool for atomic-scale imaging, were limited due to the complexity of the (atomically-thin) sample fabrication requirements. This work developed a unique way to selectively cut and re-stack monolayers of TMDs with a controlled rotational twist angle which could then be easily suspended on a TEM grid to meet the needs of the atomically thin sample requirements. The fabrication technique enabled the study of the two common stacking-polytypes including 3R and 2H (using MoS<sub>2</sub> and WS<sub>2</sub> as the example) as well as their structural evolution with decreasing twist-angle. Atomic-scale studies were followed by a comprehensive investigation of their electronic properties

using scanning probe microscopy and electrical transport measurements of the artificially-engineered structures. The electronic structure of two common stacking-polytypes (3R and 2H) were strikingly different, as revealed by conductive atomic force microscopy. Further studies focused on the 3R-stacking polytype to reveal room-temperature out-of-plane ferroelectricity using tools such as kelvin probe force microscopy, scanning electron microscopy and electrical transport measurements. This work highlights that the unique intrinsic properties of TMDs (i.e. semiconductors with strongly light-matter interaction) combined with the additional twisted degree-of-freedom has great potential to create atomically thin transistors/LEDs with built-in memory storage functions and will further aid in the development of the next generation of optoelectronics.

The aim of this major reference work is to provide a first point of entry to the literature for the researchers in any field relating to structural integrity in the form of a definitive research/reference tool which links the various sub-disciplines that comprise the whole of structural integrity. Special emphasis will be given to the interaction between mechanics and materials and structural integrity applications. Because of the interdisciplinary and applied nature of the work, it will be of interest to mechanical engineers and materials scientists from both academic and industrial backgrounds including bioengineering, interface engineering and nanotechnology. The scope of this work encompasses, but is not restricted to: fracture mechanics, fatigue, creep, materials, dynamics, environmental degradation, numerical methods, failure mechanisms and damage mechanics, interfacial fracture and nano-technology, structural analysis, surface behaviour and

heart valves. The structures under consideration include: pressure vessels and piping, off-shore structures, gas installations and pipelines, chemical plants, aircraft, railways, bridges, plates and shells, electronic circuits, interfaces, nanotechnology, artificial organs, biomaterial prostheses, cast structures, mining... and more. Case studies will form an integral part of the work.
