An introduction to

biological networks and

methods for

their analysis Analysis

of Biological Networks

is the first book of

its kind to provide

readers with a

comprehensive

introduction to

the structural analysis

of biological networks at the interface of biology and computer science. The book begins with a brief overview of biological networks and graph theory/graph algorithms and goes on to explore: global network properties, network centralities, network motifs, network clustering, Petri nets, signal transduction and gene regulation networks, protein interaction networks, metabolic networks, phylogenetic networks, ecological networks, and correlation networks. Analysis of Biological Networks is a self-contained introduction to this important research topic, assumes no expert knowledge in

computer science or biology, and is accessible to professionals and students alike. Each chapter concludes with a summary of main points and with exercises for readers to test their understanding of the material presented. Additionally, an FTP site with links to author-provided data for the book is available for deeper study. This book is suitable as a resource for researchers in computer science, biology, bioinformatics, advanced biochemistry, and the life sciences, and also serves as an ideal reference text for graduate-level courses in bioinformatics and biological research. The Pyramid Principle

John Wiley & Sons
Dubbed by his fellow
Futurists the "King of
Time," Velimir
Khlebnikov
(1885-1922) spent his
entire brief life
searching for a new
poetic language to
express his convictions
about the rhythm of
history, the
correspondence
between human
behavior and the
"language of the
stars." The result was a
vast body of poetry
and prose that has
been called hermetic,
incomprehensible,
even deranged. Of all
this tragic generation
of Russian poets
(including Blok, Esenin,
and Mayakovsky),
Khlebnikov has been
perhaps the most
praised and the more
censured. This first
volume of the
Collected Works, an

edition sponsored by
the Dia Art Foundation,
will do much to
establish the
counterimage of
Khlebnikov as an
honest, serious writer.
The 117 letters
published here for the
first time in English
reveal an ebullient,
humane, impractical,
but deliberate working
artist. We read of the
continuing involvement
with his family
throughout his
vagabond life (pleas to
his smartest sister,
Vera, to break out of
the mold, pleas to his
scholarly father not to
condemn and to send a
warm overcoat); the
naive pleasure he took
in being applauded by
other artists; his
insistence that a young
girl's simple verses be
included in one of the
typically outrageous
Futurist publications of

the time; his jealous fury at the appearance in Moscow of the Italian Futurist Marinetti; a first draft of his famous zoo poem ("O Garden of Animals!"); his seriocomic but ultimately shattering efforts to be released from army service; his inexhaustibly courageous confrontation with his own disease and excruciating poverty; and always his deadly earnest attempt to make sense of numbers, language, suffering, politics, and the exigencies of publication. The theoretical writings presented here are even more important than the letters to an understanding of Khlebnikov's creative output. In the scientific articles written before 1910, we discern

foreshadowings of major patterns of later poetic work. In the pan-Slavic proclamations of 1908-1914, we find explicit connections between cultural roots and linguistic ramifications. In the semantic excursions beginning in 1915, we can see Khlebnikov's experiments with consonants, nouns, and definitions spelled out in accessible, if arid, form. The essays of 1916-1922 take us into the future of Planet Earth, visions of universal order and accomplishment that no longer seem so farfetched but indeed resonate for modern readers.

This is a textbook for a one-term course whose goal is to ease the transition from lower-division calculus courses to upper-division courses in linear and abstract algebra, real and complex analysis, number theory,

topology, combinatorics, and so on. Without such a "bridge" course, most upper division instructors feel the need to start their courses with the rudiments of logic, set theory, equivalence relations, and other basic mathematical raw materials before getting on with the subject at hand. Students who are new to higher mathematics are often startled to discover that mathematics is a subject of ideas, and not just formulaic rituals, and that they are now expected to understand and create mathematical proofs. Mastery of an assortment of technical tricks may have carried the students through calculus, but it is no longer a guarantee of

academic success. Students need experience in working with abstract ideas at a nontrivial level if they are to achieve the sophisticated blend of knowledge, discipline, and creativity that we call "mathematical maturity." I don't believe that "theorem-proving" can be taught any more than "question-answering" can be taught. Nevertheless, I have found that it is possible to guide students gently into the process of mathematical proof in such a way that they become comfortable with the experience and begin asking themselves questions that will lead them in the right direction.
