of names of countries

CRC Press
Based on
investigations across
Europe and North
America, this report
addresses the key
areas of interest to
architects, engineers,
manufacturers,

installers and building owners. Recommendations are given on the specification of appropriate materials (including insurance and guarantee arrangements), design guidance, installation and maintenance and on the need for training of installers. Areas requiring further research and standardisation are also identified.

Bs 7428 Thomas
Telford

This detailed book covers causes, soluble salts, prevention and removal of discoloration. It also provides a checklist for the practitioner.

The Mechanical and
Physical Properties of
the British Standard En
Steels (B.S. 970 -
1955), Volume 2
focuses on the most
commonly used range
of steels in the United
Kingdom - B.S.970 En
Steels. The publication
first offers information
on 3 percent nickel
steel and 3 1/2 percent

nickel steel. Concerns focus on welding, machinability, hot working and heat treatment temperatures, physical properties, transformation characteristics, and hardenability. The text then explores 3 percent nickel-chromium steel, 1 1/2 percent nickel-chromium-molybdenum steel, and 2 1/2 percent nickel-chromium-molybdenum steel (medium carbon). The manuscript takes a look at 2 1/2 percent nickel-chromium-molybdenum steel (high carbon) and 3 percent nickel-chromium-molybdenum steel. Topics include welding, machinability, hot working and heat treatment

temperatures, continuous cooling transformation, hardenability, and physical properties. The text also ponders on 4 1/4 percent nickel-chromium steel (with or without molybdenum), 1 percent carbon-chromium steel, and carbon case-hardening steel. The publication is a dependable source material for readers interested in the mechanical and physical properties of steels.

The construction of

buildings is learnt through experience and the inheritance of a tradition in forming buildings over several thousand years. Successful construction learns from this experience which becomes embodied in principles of application. Though materials and techniques change, various elements have to perform the same function. 'Principles of Element Design' identifies all the relevant elements and then breaks these elements down into all their basic constituents, making it possible for students to fully understand the given theory and principles behind each part. As all building projects are subject to guidance through the Building Regulations

and British Standards, this book gives an immediate reference back to relevant information to help practitioners and contractors identify key documents needed. Yvonne Dean B.A. (Hons) B.A (Open) RIBA, an architect, energy consultant and materials technologist. She also has 15 years experience as a lecturer, travels widely and is a guest lecturer at many universities. She pioneered an access course for Women into Architecture and Building, which has been used as a template by others, and has been instrumental in helping to change the teaching of technology for architects and designers. Peter Rich AA Dipl. (Hons)

Architect, started his career with 14 years experience as a qualified architectural technician. He then joined the AA School of Architecture, working with Bill Allen and John Bickerdike after his graduation, later becoming a partner of Bickerdike Allen Rich and Partners. He also taught building construction at the Bartlett School of Architecture, University College London, and architectural design at the Polytechnic of North London. He now acts as a Consultant.

Bs 6157 Geological Society of London Analyses, in conjunction with Internal Components, the performance requirements of building components and the effectiveness of typical solutions.

External components integrates logically with the theoretical aspects explored in other titles in the Mitchell's building series. It encourages evaluation of alternative methods for putting components together.

Journal of the Society of Environmental Engineers

There is considerable academic and practical interest in stone and stone buildings, as exemplified by the wide range of high-quality and innovative work being conducted in the pursuit of the effective preservation and restoration of historic buildings. This is reflected in the numerous publications on stone and stone buildings that regularly find their way into the

public domain. Not least amongst these are a number of Geological Society Special Publications, which have appeared in recent years. This current volume seeks to bring to the attention of the various professionals in the field (geologists, architects, engineers, conservators and conservation scientists) recent work centred on the characterization and performance of this important resource and its use in historic buildings. The volume has wider relevance, including to those interested in the heritage of stone.

Register of Research

A new edition of a well-known and respected book. This book

provides a thorough guide for structural engineers on the use of concrete masonry. The second edition of the Concrete Masonry Designer's Handbook is the only handbook to provide information on all the new CEN TC125 masonry standards, as well as detailed guidance on design to Eurocode 6. Th
