 The Work Breakdown Structure (WBS) serves as a guide for defining work as it relates to a specific project's objectives. This book supplies project managers and team members with direction for the preliminary development and the implementation of the WBS. Consistent with A Guide to the Project Management Body of Knowledge (PMBOK® Guide)-Sixth Edition, the WBS Practice Standard presents a standard application of the WBS as a project management tool. Throughout the book, the reader will learn what characteristics constitute a high-quality WBS and discover the substantial benefits of using the WBS in every-day, real-life situations.

Because of the increasing complexity of an air traffic controller's job and the increasing number of displays and sources, it is necessary to identify options for integrating tower equipment and systems by centralizing the sources of information and reducing equipment space requirements. A study was initiated to conduct human factors assessments and technical investigations and to present findings in a manner that may be used directly in the design of integrated Air Traffic Control (ATC) towers. Interim report 1 provided a work plan for the entire study and presented findings from an evaluation of planned Canadian Airspace System subsystems and a review of the functional requirements in ATC towers defined by the SEI functional requirements specification. Interim report 2 looked at the concept of an interim tower computer complex and provided human factor guidelines to be used in the assessment of candidate systems for equipment integration. This report amalgamates the two interim reports, the results of a review of the system engineering integration project (SEIP) national transition plan and site transition plan, and a recommended work breakdown structure for the next phase in the complete tower integration program.

This volume explores the field of transport sector development. Derived from the 2015 TranSopot conference held in Sopot, Poland, it discusses current trends, issues, and research on the topic. Specifically, it aims to explore sustainable development, examines current problems ranging from transport systems to transport enterprises and provides a variety of analytical methods such as economic and econometric analysis. The three most important fields of current transport research are sustainable transport development, innovation and technological progress and the conditions of transport enterprise growth and survival. Transport is an activity which is supposed to be sustainable, environmentally aware, economically optimal, socially sound and politically responsible. Striving for innovation in transport means looking for organizational and technical solutions which increase the efficiency, effectiveness and safety of transportation. However, the main research issue in the field are strategies for sustainable transport developments in urban and rural areas, instruments of internalization of external transport costs, promotion of environmentally-friendly transport behavior and improvement of transport energy efficiency. Transport infrastructure innovation, intelligent transport systems, innovations in management and finance are some of the main concerns of researchers and policy-makers in the field. Transport enterprises need to adapt to the conditions of the new economic growth perspectives. They need to create unique growth conditions, otherwise they will condemn themselves to struggle for survival. In particular, transport enterprises have to create special functioning systems and programs to diversify economic activity to use funds in the most efficient ways possible.

The ever expanding market need for information on how to apply project management principles and the PMBOK® contents to day-to-day business situations has been met by our case studies book by Harold Kerzner. That book was a spin-off from and ancillary to his best selling text but has gained a life of its own beyond adopters of that textbook. All indications are that the market is hungry for more cases while our own need to expand the content we control, both in-print and online would benefit from such an expansion of project management "case content". The authors propose to produce a book of cases that compliment Kerzner's book. A book that offers cases beyond the general project management areas and into PMI®'s growth areas of program management and organizational project management. The book will be structured to follow the PMBOK in coverage so that it can not only be used to supplement project management courses, but also for self study and training courses for the PMP® Exam. This report documents and presents the results of a study to determine the feasibility of applying Artificial Intelligence (AI) techniques to the diagnosis of transit railcars. The AI techniques investigated were expert systems, case-based reasoning, model-based reasoning, artificial neural networks, computer vision, fuzzy logic, and a procedural knowledge-based system. Site surveys were conducted at transit railcar maintenance facilities and at railcar subsystem suppliers. The site surveys gathered information about current and future diagnostic and maintenance practices, possible barriers to implementing advanced AI technology, and maintenance cost data. An economic analysis was performed to provide an estimate of cost savings expected by reducing the diagnostic effort.

Effective project management tailored to the needs of the telecommunications industry "In our rapidly changing world, the information and communication technologies and services have an immense impact on virtually all aspects of our lives. . . . With his deep understanding of the telecommunication services, and his rich experiences in both standardization activities and teaching practice, [Dr. Sherif's] book provides a very clear analysis of development projects in telecommunication services. I believe the readers will find this book very useful and interesting." —Houlin Zhao, Director, Telecommunication Standardization Bureau, International Telecommunication Union "Dr. Sherif's book is an important contribution to the project management literature. With the domination of the service economy in recent years, the book addresses the unique features of telecommunication services, a critical pillar of the service sector. Development projects in telecommunications require combining good knowledge of the fundamentals of project management with clear understanding of the complexities arising from fast-changing technology, deregulations, standards, accountability, and supply chain management difficulties. This book addresses the much-needed integrative approach very well." —Tarek Khalil, President, International Association for Management of Technology (IAMOT) While there has been much written about project management, the vast majority of the literature focuses on industrial design and production. In *Managing Projects in Telecommunication Services*, Mostafa Hashem Sherif effectively demonstrates the unique requirements of projects in telecommunication services and, consequently, the benefits of an integrated approach to project management that is specifically tailored to the telecommunications industry. *Managing Projects in Telecommunication Services* draws from a wide range of disciplines, including organizational management, motivation, quality control, and software engineering. All the theory and practical guidance that an effective telecommunications project manager needs is provided. The text is divided into three main parts: Chapters 1 through 3 set forth the special characteristics of telecommunications projects, including technology life cycle, type of innovation, and project organization Chapters 4 through 10 cover the areas that the Project Management Institute has standardized in its publication *A Guide to the Project Management Body of Knowledge (PMBOK® Guide)*, focusing on the issues specific to telecommunications. Chapters address scope, schedule and

cost, information and communication, human resources, quality, vendor management, and risk Chapters 11 and 12 integrate and summarize all of the concepts for the planning and delivery of a project Chapters are loaded with examples and case studies, many from the author's personal experience, that demonstrate the benefits of good project management and the consequences of poor project management. Each chapter includes a summary of key points. References are also provided to facilitate further research and study. For project managers as well as students in telecommunications, this text is unsurpassed. It not only covers the theory and practice of effective project management, it also tailors its discussion specifically to the unique needs of the telecommunications industry.
