EINSTEIN'S UNIVERSE WITHOUT BIG BANG Arihant Publications India limited
 Are we alone in the universe? How did life arise on our planet? How do we search for life beyond Earth? These profound questions excite and intrigue broad cross sections of science and society. Answering these questions is the province of the emerging, strongly interdisciplinary field of astrobiology. Life is inextricably tied to the formation, chemistry, and evolution of its host world, and multidisciplinary studies of solar system worlds can provide key insights into processes that govern planetary habitability, informing the search for life in our solar system and beyond. Planetary Astrobiology brings together current knowledge across astronomy, biology, geology, physics, chemistry, and related fields, and considers the synergies between studies of solar systems and exoplanets to identify the path needed to advance the exploration of these profound questions. Planetary Astrobiology represents the combined efforts of more than seventy-five international experts consolidated into twenty chapters and provides an accessible, interdisciplinary gateway for new students and seasoned researchers who wish to learn more about this expanding field. Readers are brought to the

frontiers of knowledge in astrobiology via results from the exploration of our own solar system and exoplanetary systems. The overarching goal of Planetary Astrobiology is to enhance and broaden the development of an interdisciplinary approach across the astrobiology, planetary science, and exoplanet communities, enabling a new era of comparative planetology that encompasses conditions and processes for the emergence, evolution, and detection of life.

 Nature, is sometimes beautiful landscapes. Sometimes bad storms. Always nature is our home address. Nature gives us our elements and air, food and water. Nature also includes all that is alive. So, nature is full of life or not. 99% of the life that has ever lived on Earth is not alive today. Nature - Links of Life is the true story of the connection between rocks, plants and us humans. We live in an awesome, colorful but ever changing world. The book - Big Die, is the story of the theories of earth's mass extinctions. The causes include too cold then too hot weather around the world. Also, atmosphere is a contributor as the amounts of oxygen and green house gases change over time. Other causes are from space. This includes collisions with comets and asteroids to killer radiation rays from star bursts. Fossils show us that our home planet can turn hostile. The hope for the human race is to take care of our current home planet. Even, as we explore space to build a backup place to call home.

 The Rough Guide to Surviving the End of the World is a light-hearted yet well-informed look at threats to the very existence of life on Earth, how we might be able to deal with them and-if things go truly, horribly wrong-how we might just be able to survive. Written by scientist and sci fan Paul Parsons, this gripping book examines scenarios ranging from megafloods to space radiation, supervolcanoes to bioengineering and what you should do when the sh*t hits the fan. Along the way, we meet some of the lesser-trodden paths to oblivion, including the possibility that the human race will be gripped by mass stupidity and the outrageous idea that life on Earth could all be one giant Matrix-style computer simulation that its creators might one day decide to switch off. All are placed under the scientific spotlight and presented with clarity and humor. To survive Armageddon you need the best advice and information available, which is here presented in ample detail and capturing every plausible catastrophic scenario.

 One of Vox's Most Important Books of the Decade New York Times Editors' Choice 2017 Forbes Top 10 Best Environment, Climate, and Conservation Book of 2017 As new groundbreaking research suggests that climate change played a major role in the most extreme catastrophes in the planet's history, award-winning science journalist Peter Brannen takes us on a wild ride through

the planet's five mass extinctions and, in the process, offers us a glimpse of our increasingly dangerous future. Our world has ended five times: it has been broiled, frozen, poison-gassed, smothered, and pelted by asteroids. In *The Ends of the World*, Peter Brannen dives into deep time, exploring Earth's past dead ends, and in the process, offers us a glimpse of our possible future. Many scientists now believe that the climate shifts of the twenty-first century have analogs in these five extinctions. Using the visible clues these devastations have left behind in the fossil record, *The Ends of the World* takes us inside "scenes of the crime," from South Africa to the New York Palisades, to tell the story of each extinction. Brannen examines the fossil record—which is rife with creatures like dragonflies the size of sea gulls and guillotine-mouthed fish—and introduces us to the researchers on the front lines who, using the forensic tools of modern science, are piecing together what really happened at the crime scenes of the Earth's biggest whodunits. Part road trip, part history, and part cautionary tale, *The Ends of the World* takes us on a tour of the ways that our planet has clawed itself back from the grave, and casts our future in a completely new light.
